Electromagnetic Energy Transmission: This involves the use of electromagnetic waves to transmit energy wirelessly. Emrod's system, for instance, uses a tightly collimated beam to send energy through the air, potentially enabling efficient power transfer over long distances without physical connections. Na-TECC (Sodium Thermal Electrochemical Converter): This technology utilizes the isothermal expansion of sodium and solar heat to directly generate electricity. It's an interesting approach to harnessing renewable energy, particularly solar power, in a potentially efficient manner. These technologies could play a significant role in the future of energy transmission and generation, especially in scenarios where traditional wired transmission is impractical or inefficient. They align with broader trends in energy innovation, focusing on efficiency, sustainability, and the integration of renewable energy sources.		54
